WEEKLY STUDENT INTERNSHIP JOURNAL

STUDENT INTERN: Mar John S. Refrea	PROGRAM: BSIT
DATE: Jan 16-23, 2026	

WEEK 5

ACCOMPLISHMENT	DIFFICULTIES ENCOUNTERED	NEW LEARNING/ INSIGHTS
Deployment and Orientation • Reported for OJT and was temporarily assigned to the Admin Department. • Endorsed to the Accounting Department with my co-intern. Administrative Tasks • Assisted in receiving and processing documents for signatures. • Helped print official documents and learned to operate the office printer. System Development (Document Tracking System) • Conducted requirements gathering with the Accounting Supervisor. • Identified system features and clarified document workflow. • Created data mapping and proposed system flow. • Presented and secured approval of the proposed workflow. • Started system development, focusing on frontend design and layout planning.	One of the initial challenges I experienced was adjusting to a professional work environment. Since it was my first week, I felt nervous and hesitant when communicating with supervisors and accounting staff. As someone who is still building confidence in professional communication, initiating discussions and asking detailed questions required extra effort. During the requirements gathering stage, a designated accountant explained to us the document tracking process. However, because it was our first time handling a real-world office system, we were not immediately able to clarify every function and process in detail. We were also initially hesitant to ask too many follow-up questions, as we wanted to be respectful of her time and responsibilities. As a result, there were instances where instead of confirming directly, we searched online for references on how document tracking systems are commonly structured. While this helped us gain general ideas, we later realized that every organization has its own specific workflow. It would have been more accurate and efficient to clarify all functional details directly with the assigned accountant to ensure that the system perfectly matched their actual process. In the development phase, another challenge was designing the frontend without a clearly defined theme or visual preference from the department. Since we were still in the process of consultation, we created a temporary layout based on our own interpretation. This made the design process more challenging because we needed to ensure that the interface would eventually align with their expectations. We also encountered challenges in: • Structuring a user-friendly and organized layout • Positioning interface elements efficiently	During my first week, I learned that effective communication is just as important as technical skills in system development. While programming knowledge allows us to build systems, accurate communication ensures that what we build truly matches the needs of the users. A system is not only about code — it is about solving real problems in a specific work environment. I realized that researching online can provide general knowledge and best practices about document tracking systems. However, it cannot replace direct clarification from the actual users. Every organization has its own workflow, internal controls, and approval processes. Because of this, assumptions based on generic references may not fully align with the department's real operations. It is more professional and efficient to ask clear and direct questions to ensure that every function in the system reflects their actual process. I also learned the importance of detailed requirements gathering before starting development. Even small misunderstandings in process flow can affect the structure of the database, system logic, and user interface. Taking time to clarify features and workflows at the beginning can reduce revisions, save development time, and improve overall system quality. Another key insight was the value of usercentered design. Frontend development is not only about making the system visually appealing but also about ensuring that it is intuitive, organized, and easy to use. Since the system will be used daily by accounting staff, clarity, accessibility, and efficiency are more important than complex designs. A clean and functional interface supports productivity. Additionally, I realized that professional growth requires confidence and initiative. Feeling nervous is normal, especially in a new environment, but learning to communicate despite hesitation is part of becoming a professional. Being proactive

	• Ensuring the system would be intuitive for accounting staff • Translating real-life document processes into a structured digital workflow Balancing functionality and visual design proved to be more complex than expected, especially since the system will be used in a professional office setting where accuracy and efficiency are important	in asking questions and seeking clarification strengthens collaboration and leads to better project outcomes. Lastly, this experience taught me that real world system development is different from academic projects. In school, requirements are often fixed and clearly defined. In a professional setting, requirements evolve through discussion, feedback, and revisions. Adaptability, patience, and continuous learning are essential in delivering a system that truly meets organizational needs.
